

Faculty Guide on Teaching and Generative AI

Illinois Tech's mission lends itself to authentic, student-centered teaching. In alignment with that mission, the Center for Learning Innovation guides instructors with best practices to prepare Illinois Tech students to critically and productively engage with new and innovative technologies—like generative AI—to become innovators and leaders of the future. CLI hosts events like the Learning Innovation Symposium to bring faculty together from across the university to discuss topics like generative AI and share successful strategies related to teaching and learning.

Best practices include guidance and resources on student-centered teaching with AI, from developing syllabus language, aligning the use of generative AI to course learning objectives and developing assessments. [Academic Affairs](#), the [Galvin Library](#), [CAC](#) and the [Center for Ethics in the Profession](#) also have a number of resources on generative AI. As generative AI continues to evolve, CLI will continue to identify, curate, develop, and distribute best practices to support instructors and student success at Illinois Tech.

Guiding principles to inform best practice in teaching with generative AI

- **Clear and frequent communication with students is essential.** Students need transparency when it comes to instructor expectations and the use of AI in the classroom. Expectations around AI use will vary from class to class. Frequent discussions about instructor expectations, course learning objectives, and the relationship between them with the related learning activities and student work—including the use of generative AI—enhances student learning experiences and minimizes opportunities for misunderstanding or misuse.
- **Generative AI systems are technology tools.** And like other technology tools like Blackboard, Zoom, and even Google search, generative AI can be used to positively support rigorous learning and enhance engaging learning experiences.
- **The use of generative AI will evolve.** Instructors and students should use generative AI responsibly, purposefully, and ethically.
- **If supported by the course learning objectives, instructors should design assessments and learning activities in a way that students can use generative AI as opportunities to learn.** Students can better achieve their course learning objective and learn more about the benefits and challenges when using generative AI.

Best practices to consider as you plan your course in light of generative AI

- Use backwards design concepts to align course learning objectives to assessments and related active learning activities. Doing so can reveal how generative AI could be used to make a positive impact in your course.
- Post clear expectations on the use of AI in your course syllabus. [Academic Affairs](#) provides some brief examples of possible language. Externally, many [additional examples](#) are being collected by [Lance Eaton](#) from instructors around the country and posted in an open Google Doc; [WCET](#) highlighted 3:

No use of AI	<p>“All work submitted in this course must be your own. Contributions from anyone or anything else- including AI sources, must be properly quoted and cited every time they are used. Failure to do so constitutes an academic integrity violation, and I will follow the institution’s policy to the letter in those instances.”</p> <p><i>A theater course at a small liberal arts college.</i></p>
Some use of AI	<p>“You might be permitted to use generative AI tools for specific assignments or class activities. However, assignments created with AI should not exceed 25% of the work submitted and must identify the AI-generated portions. Presenting AI-generated work as your own will have consequences according to university policies. Importantly, while AI programs like ChatGPT can help with idea generation, they are not immune to inaccuracies and limitations. Further, overreliance on AI can hinder independent thinking and creativity. Note that, in the spirit of this policy, it was written in part by ChatGPT.”</p> <p><i>A marketing course at a public university</i></p>
Significant Use of AI	<p>“Within this course, you are welcome to use generative artificial intelligence (AI) models (ChatGPT, DALL-E, GitHub Copilot, and anything after) with acknowledgment. However, you should note that all large language models have a tendency to make up incorrect facts and fake citations, they may perpetuate biases, and image generation models can occasionally come up with offensive products. You will be responsible for any inaccurate, biased, offensive, or otherwise unethical content you submit regardless of whether it originally comes from you or an AI model.</p> <p>If you use an AI model, its contribution must be cited and discussed:</p> <ul style="list-style-type: none"> · What was your prompt? · Did you revise the Ai model’s original output for your submission? · Did you ask follow-up questions? · What did you learn? <p>Having said all these disclaimers, the use of AI models is encouraged, as it may make it possible for you to submit assignments and your work in the field with higher quality and in less time.”</p> <p><i>A graduate level library sciences course at a public university</i></p>

- If you use text-matching software or anti-plagiarism checkers such as Blackboard’s SafeAssign or [IIT’s own chatGPT detector](#), first, be sure to post that notice in your syllabus. Then encourage your students to use the tools as well. These tools compare submitted work against work in its own databases (typically other users in the same class or institution) and sometimes around the web. Tools may also report if the text resembles or is generated by generative AI. Students can use the tool as a means to ensure compliance with the class’s policy on academic honesty and the use of

generative AI. Also mention to your students that in cases of possible infringement of your course policy, a result from one or more of these tools may be used as circumstantial evidence to report the student's infringement to the DDAD. Finally, do keep in mind that the results of these tools only reveal similarity (ie, drafts and final versions of work submitted may result in 100% similarity). Reports based on these tools are typically the starting point for additional conversations before investigating actual policy infringement or actual plagiarism.

- If you embrace the use of generative AI in your course, avoid making its use a requirement, unless you plan to also offer alternative ways to achieve similar objectives. It is a question making your course accessible: not all students may have the same access or the ability to use generative AI. Offering alternatives is also a general principle in [universal design for learning](#), and can help make your course more accessible for all learners.
- Integrating AI tools, or motivating compliance with relevant rationale, can be more effective than banning, restricting and detecting AI-generated content with technology tools.
- Like many other software/apps available on the web (free or not), access to AI-based tools requires users to agree with specific terms of service and privacy policies. Instructors and students should carefully read these documents and understand the risks associated with their use, prior to accepting the terms.
